21. Image Pyramids

21. Image Pyramids

To convert an image to a size different than its original: (1) resize; (2) image pyramid

There are two kinds of Image Pyramid.

1) **Gaussian Pyramid** and 2) **Laplacian Pyramid**

Gaussian pyramids use `cv.pyrDown()` and `cv.pyrUp()` functions to downsample (zoom out) or upsample (zoom in) a given image.

Image Pyramid:

An image pyramid is a collection of images - all arising from a single original image - that are successively downsampled until some desired stopping point is reached.

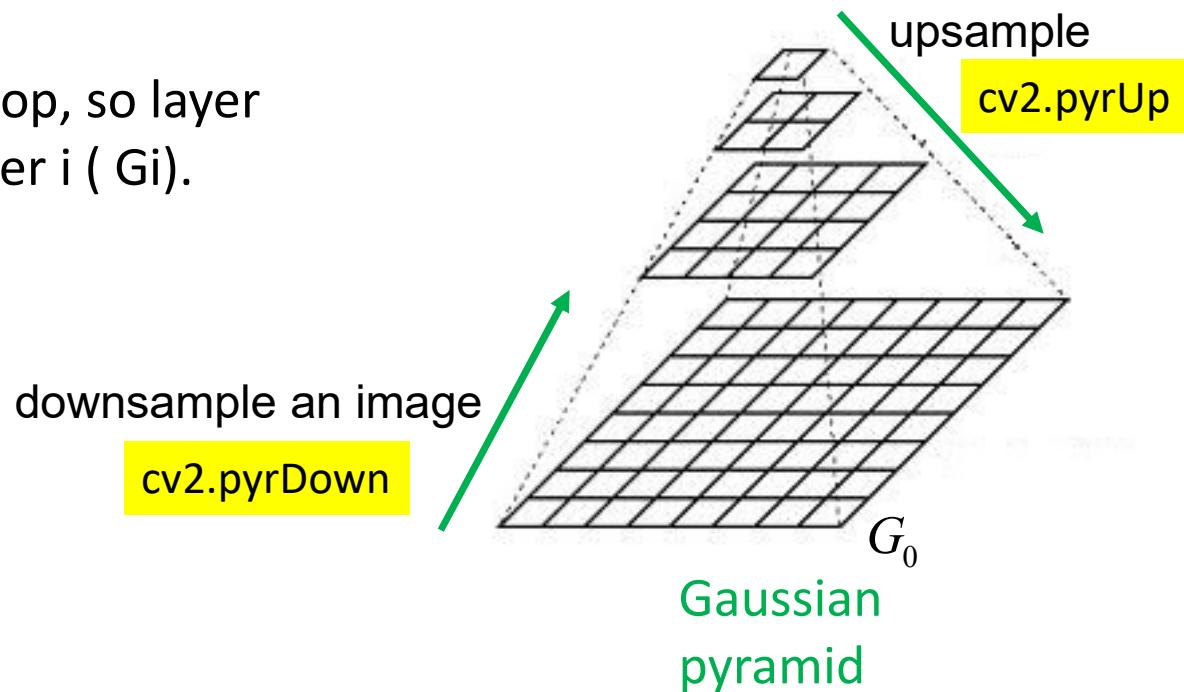

Gaussian pyramid: Used to downsample images

Laplacian pyramid: Used to reconstruct an upsampled image from an image lower in the pyramid (with less resolution)

Every layer is numbered from bottom to top, so layer $(i+1)$ (denoted as G_{i+1}) is smaller than layer i (G_i).

Convolve G_i with a Gaussian kernel:

$$\frac{1}{16} \begin{bmatrix} 1 & 4 & 6 & 4 & 1 \\ 4 & 16 & 24 & 16 & 4 \\ 6 & 24 & 36 & 24 & 6 \\ 4 & 16 & 24 & 16 & 4 \\ 1 & 4 & 6 & 4 & 1 \end{bmatrix}$$

Remove every even-numbered row and column
to obtain G_{i+1} .

The resulting image will be exactly one-quarter ($1/4$) the area of its predecessor.

Note: When we reduce the size of an image, we are actually losing information of the image.

cv2.pyrDown()函數接受3個參數：

src: 當前圖像，初始化為原圖像

dst: 目的圖像(顯示圖像，為輸入圖像的一半)

dstsize(src.cols/2, src.rows/2):目的圖像大小，既然我們是向下採樣

```
dst = cv2.pyrDown(src, dstsize =(cols//2, rows//2))
```

Python's **map(function, iterable, ...)**

map() is a built-in function that allows you to process and transform all the items in an iterable without using an explicit for loop, a technique commonly known as mapping. **map()** is useful when you need to apply a transformation function to each item in an iterable and transform them into a new iterable.

map(function, iterable, ...)

Apply function to every item of iterable and return a list of the results.

Ex1

```
listA = ['1','2','3']
print(list(map(int,listA))) # [1, 2, 3]
a,b,c = map(int, listA) # a=1, b=2, c=3
```

EX2

```
def multiple2(x):
    return x*2
```

```
list1 = [1,3,5,7,9]
print(list(map(multiple2,list1))) # [2, 6, 10, 14, 18]
```

ex26.py

```
import cv2
img = cv2.imread("lena.jpg")
print(img.shape) # (512, 512, 3)

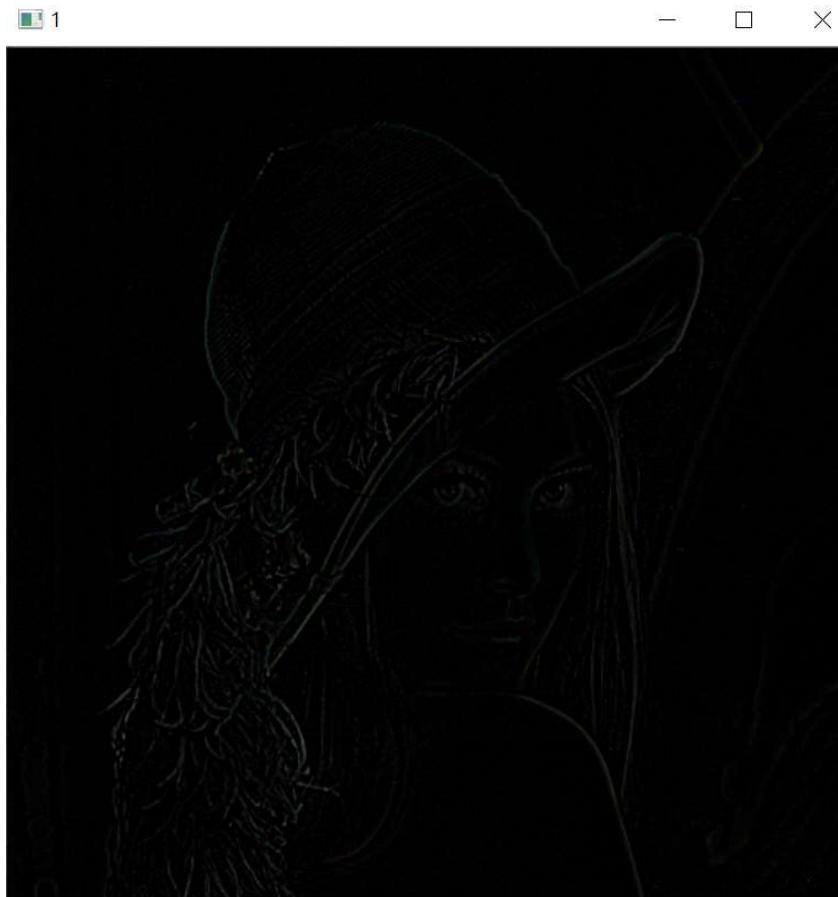

print("""
    Zoom In-Out demo
-----
* [i] -> Zoom [i]n
* [o] -> Zoom [o]ut
* [ESC] -> Close program
""")  
  
while True:
    rows, cols, _channels = map(int, img.shape)
    cv2.imshow('Pyramids Demo', img)
    k = cv2.waitKey(0)
```

```
        if k == 27:
            break
        elif chr(k) == 'i':
            img = cv2.pyrUp(img, dstsize=(2 * cols, 2 * rows))
            print ('** Zoom In: Image x 2')
        elif chr(k) == 'o':
            img = cv2.pyrDown(img, dstsize=(cols // 2, rows // 2))
            print ('** Zoom Out: Image / 2')
    cv2.destroyAllWindows()
```

can be omitted

Laplacian Pyramid:
looks like an edge detection

A level in Laplacian Pyramid is formed by the difference between that level in Gaussian Pyramid and expanded version of its upper level in Gaussian Pyramid.

```
import cv2
img = cv2.imread("lena.jpg")
layer = img.copy()
gp = [layer] # Gaussian Pyramid
for i in range(6):
    layer = cv2.pyrDown(layer)
    gp.append(layer) # List
    #cv2.imshow(str(i), layer)
```

ex27.py

512, 256, 128, 64, 32, 16, 8
Gaussian pyramid

```
layer = gp[5]
cv2.imshow('upper level Gaussian Pyramid', layer)
lp = [layer] # Laplacian Pyramid

for i in range(5, 0, -1): # 5, 4, 3, 2, 1
    gaussian_extended = cv2.pyrUp(gp[i])
    laplacian = cv2.subtract(gp[i-1], gaussian_extended)
    lp.append(laplacian)
    cv2.imshow(str(i), laplacian)

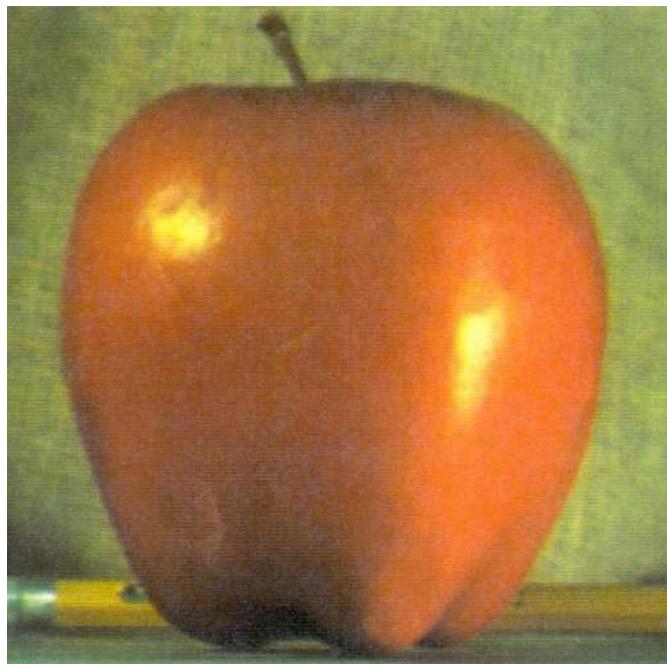

cv2.imshow("Original image", img)
cv2.waitKey(0)
cv2.destroyAllWindows()
```

16, 32, 64, 128, 256, 512
Laplacian pyramid

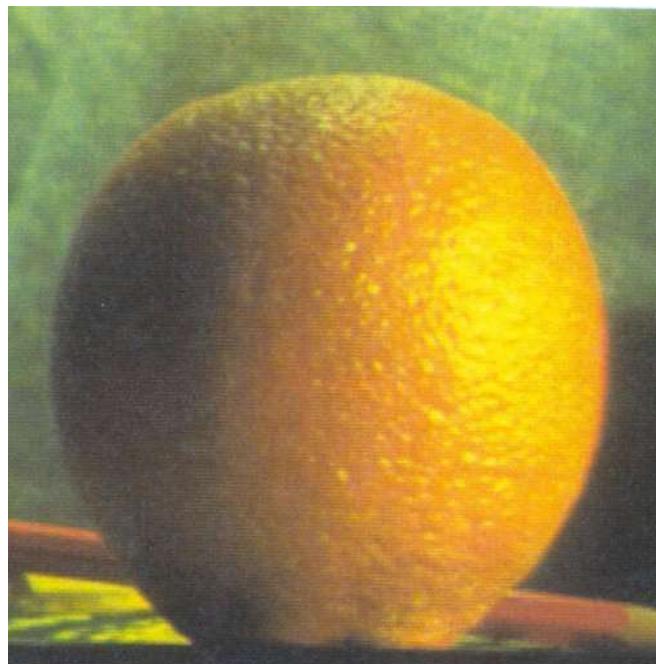

22. Image Blending using Pyramids

圖像融合

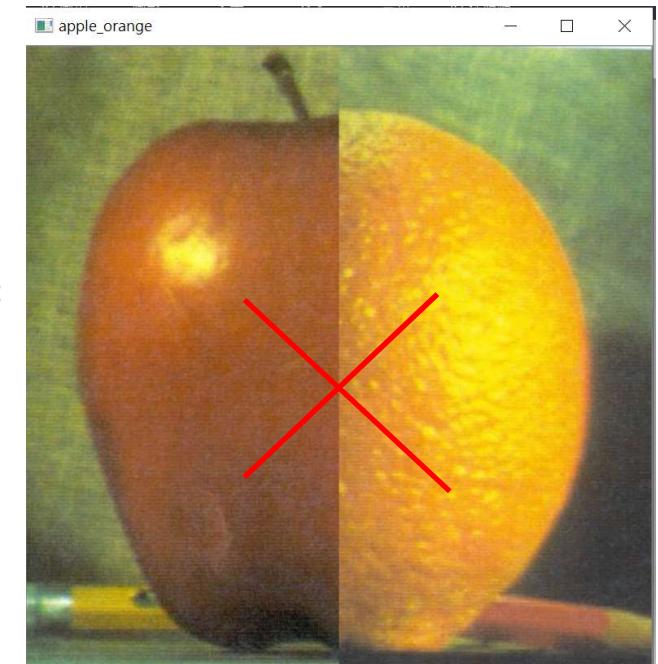

Joint the left half of apple with the right half of orange = ?

+

=

Five steps for image blending

- 6.
7.
 1. Load the two images of apple and orange.
 2. Find the Gaussian Pyramids for apple and orange (in this particular example, number of levels is 6).
 3. From Gaussian Pyramids, find their Laplacian Pyramids.
 4. Now join the left half of apple and right half of orange in each levels of Laplacian Pyramids.
 5. Finally from this joint image pyramids, reconstruct the original image.

ex28.py

```
'  
8 import cv2  
9 import numpy as np  
10 apple = cv2.imread('apple.jpg') #(512, 512, 3)  
11 orange = cv2.imread('orange.jpg') #(512, 512, 3)  
12 print(apple.shape)  
13 print(orange.shape)  
14 apple_orange = np.hstack((apple[:, :256], orange[:, 256:]))  
15  
16 # generate Gaussian pyramid for apple (7 Layers)  
17 apple_copy = apple.copy()  
18 gp_apple = [apple_copy]  
19 for i in range(6):  
20     apple_copy = cv2.pyrDown(apple_copy)  
21     gp_apple.append(apple_copy)  
22  
23 # generate Gaussian pyramid for orange (7 Layers)  
24 orange_copy = orange.copy()  
25 gp_orange = [orange_copy]  
26 for i in range(6):  
27     orange_copy = cv2.pyrDown(orange_copy)  
28     gp_orange.append(orange_copy)
```

512, 256, 128, 64, 32, 16, 8
Gaussian pyramid

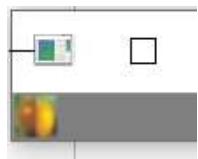

```
-->
30 # generate Laplacian Pyramid for apple (6 Layers)
31 apple_copy = gp_apple[5] #(16,16,3)
32 lp_apple = [apple_copy]
33 for i in range(5, 0, -1): # 5,4,3,2,1
34     gaussian_expanded = cv2.pyrUp(gp_apple[i])
35     laplacian = cv2.subtract(gp_apple[i-1], gaussian_expanded)
36     lp_apple.append(laplacian)
37
38 # generate Laplacian Pyramid for orange (6 Layers)
39 orange_copy = gp_orange[5] #(16,16,3)
40 lp_orange = [orange_copy]
41 for i in range(5, 0, -1): # 5,4,3,2,1
42     gaussian_expanded = cv2.pyrUp(gp_orange[i])
43     laplacian = cv2.subtract(gp_orange[i-1], gaussian_expanded)
44     lp_orange.append(laplacian)
45
46 # Now add Left and right halves of images in each Level
47 apple_orange_pyramid = [] # (6 Layers) (16, 32, 64, 128, 256, 512)
48 n = 0
49 for apple_lap, orange_lap in zip(lp_apple, lp_orange):
50     n += 1
51     rows, cols, ch = apple_lap.shape
52     laplacian = np.hstack((apple_lap[:, 0:int(cols/2)], orange_lap[:, int(cols/2):]))
53     apple_orange_pyramid.append(laplacian)
```

apple_orange_pyramid[0]

23. Find and Draw Contours

輪廓線

`cv2.findContours; cv2.drawContours`

Contours: simply as a curve joining all the continuous points (along the boundary), having same color or intensity. The contours are a useful tool for shape analysis and object detection and recognition.

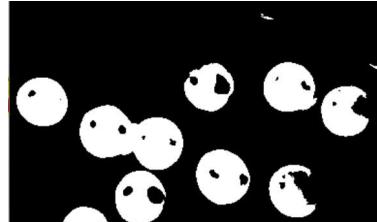

contours, hierarchy = `cv2.findContours`(thresh, cv2.RETR_TREE, cv2.CHAIN_APPROX_SIMPLE)
three arguments:

first one is **source image**: For better accuracy, use **binary images**. So before finding contours, apply threshold or canny edge detection.

second is contour retrieval mode

third is contour approximation method.

In OpenCV, finding contours is like finding white object from black background. So remember, **object to be found should be white** and **background should be black**.

23. Find and Draw Contours

```
1 import numpy as np
2 import cv2
3
4 img = cv2.imread('opencv-logo.png')
5 imgray = cv2.cvtColor(img, cv2.COLOR_BGR2GRAY)
6 ret, thresh = cv2.threshold(imgray, 127, 255, 0)
7 contours, hierarchy = cv2.findContours(thresh, cv2.RETR_TREE, cv2.CHAIN_APPROX_NONE)
8
9 cv2.imshow('Image', img)
10 cv2.imshow('Image GRAY', imgray)
11 cv2.waitKey(0)
12 cv2.destroyAllWindows()
```

contours is a Python list of all the contours in the image. Each individual contour is a Numpy array of (x,y) coordinates of boundary points of the object.

```
cv2.findContours(thresh, cv2.RETR_TREE, cv2.CHAIN_APPROX_SIMPLE)
```

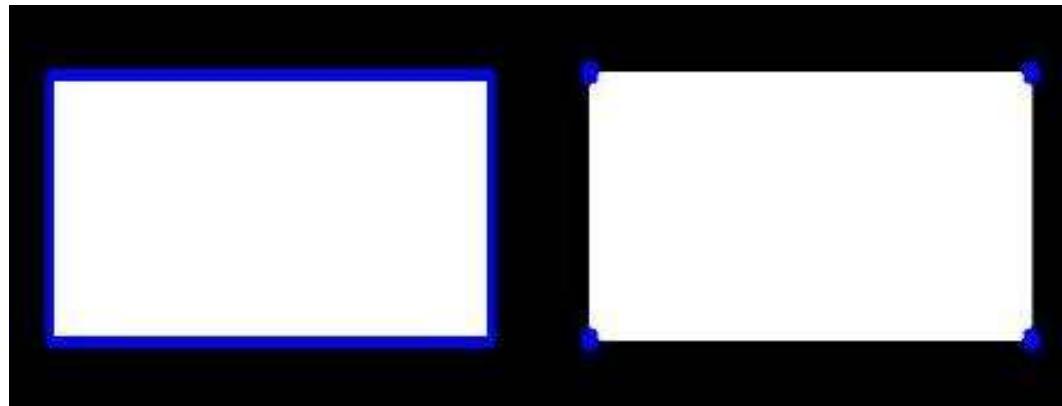

Contour Approximation Method: the third argument in cv2.findContours function.

cv2.CHAIN_APPROX_NONE: all the boundary points are stored

cv2.CHAIN_APPROX_SIMPLE: It removes all redundant points and compresses the contour, thereby saving memory.

cv2.CHAIN_APPROX_NONE

cv2.CHAIN_APPROX_SIMPLE

To draw **all** the contours in an image:

```
img = cv2.drawContours(img, contours, -1, (0,255,0), 3)
```

To draw an individual contour, say **4th contour**:

```
img = cv2.drawContours(img, contours, 3, (0,255,0), 3)
```

cv2.drawContours:

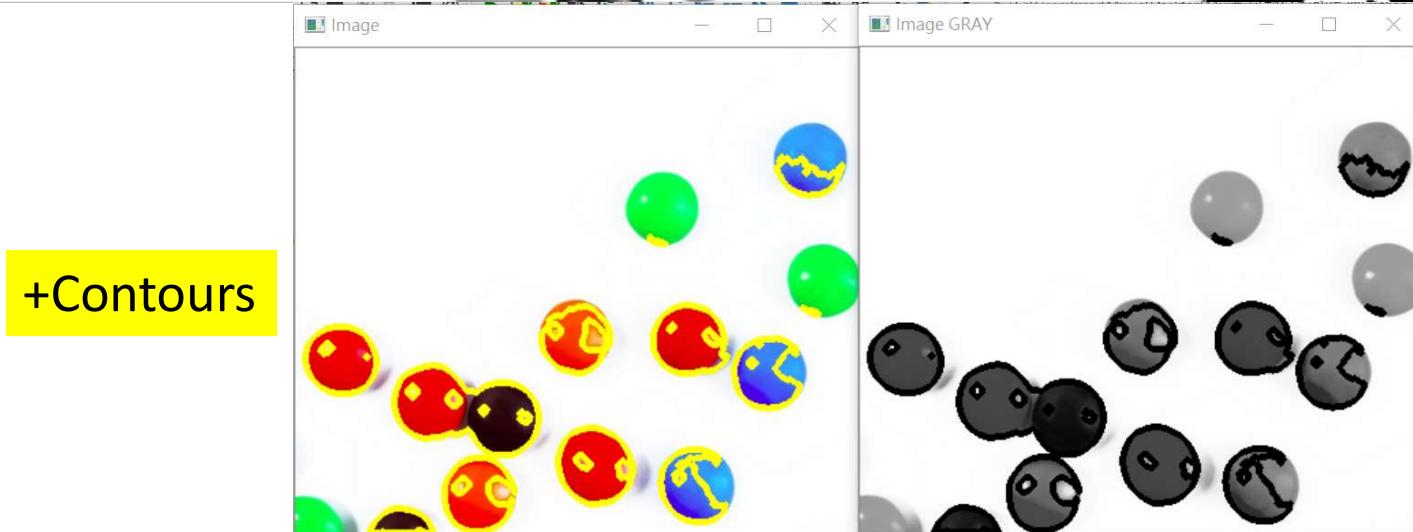

first argument is **source image**,

second argument is the **contours**,

third argument is **index of contours** (useful when drawing individual contour.

To draw all contours, pass -1)

and remaining arguments are **color, thickness**.

ex29.py

Number of contours = 31

```
8 import numpy as np
9 import cv2
10
11 img = cv2.imread('smarties.png')
12 imggray = cv2.cvtColor(img, cv2.COLOR_BGR2GRAY)
13 ret, thresh = cv2.threshold(imggray, 127, 255, 1) # cv2.THRESH_BINARY_INV
14 contours, hierarchy = cv2.findContours(thresh, cv2.RETR_TREE, cv2.CHAIN_APPROX_NONE)
15 print("Number of contours = " + str(len(contours)))
16 print(contours[0])
17
18 cv2.drawContours(img, contours, -1, (0, 255, 255), 3) # yellow contour
19 cv2.drawContours(imggray, contours, -1, (0, 255, 255), 3)
20 cv2.drawContours(thresh, contours, -1, (0, 255, 255), 3)
21
22 cv2.imshow('Image', img)
23 cv2.imshow('Image GRAY', imggray)
24 cv2.imshow('Image Binary', thresh)
25 cv2.waitKey(0)
26 cv2.destroyAllWindows()
```

contours[0].shape
Out[2]: (104, 1, 2)

24. Motion Detection and Tracking Using Opencv Contours

(Tracking moving objects
with a bounding rectangle)

Optical flow (光流) is the motion of objects between consecutive frames of sequence, caused by the relative movement between the object and camera.

`dst=cv2.absdiff(src1, src2[, dst])`

`area = cv2.contourArea(cnt)`

`x, y, w, h = cv.boundingRect(cnt)`

(x, y) the top-left coordinate of the rectangle
(w, h) its width and height.

24. Motion Detection and Tracking Using Opencv Contours

ex30.py

```
import cv2  
  
cap = cv2.VideoCapture('vtest.avi')  
ret, frame1 = cap.read()  
ret, frame2 = cap.read()
```

(Tracking moving objects
with a bounding rectangle)

```
while cap.isOpened():
    diff = cv2.absdiff(frame1, frame2)
    gray = cv2.cvtColor(diff, cv2.COLOR_BGR2GRAY)
    blur = cv2.GaussianBlur(gray, (5,5), 0)
    _, thresh = cv2.threshold(blur, 20, 255, cv2.THRESH_BINARY)
    dilated = cv2.dilate(thresh, None, iterations=3)
    contours, _ = cv2.findContours(dilated, cv2.RETR_TREE, cv2.CHAIN_APPROX_SIMPLE)
```

ex30.py

```
for contour in contours:
```

```
    (x, y, w, h) = cv2.boundingRect(contour)
```

```
    if cv2.contourArea(contour) < 900:
```

```
        continue
```

```
        cv2.rectangle(frame1, (x, y), (x+w, y+h), (0, 255, 0), 2)
```

```
        cv2.putText(frame1, 'Status:Movement', (10, 20), cv2.FONT_HERSHEY_SIMPLEX,
                   1, (0, 0, 255), 3)
```

```
#cv2.drawContours(frame1, contours, -1, (0, 255, 0), 2) # green (Tracking moving objects with contours)
```

```
cv2.imshow('feed1',dilated)
```

```
cv2.imshow('feed2',frame1)
```

```
frame1 = frame2
```

```
ret, frame2 = cap.read()
```

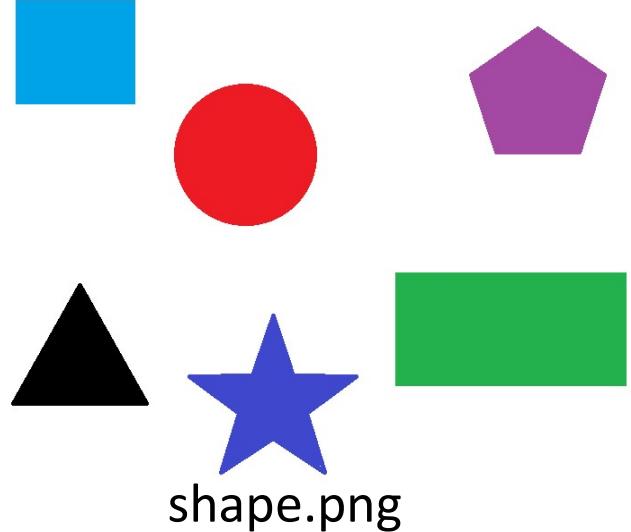

```
if ret == False:
    break
if cv2.waitKey(40) == 27:
    break
```

```
cap.release()
cv2.destroyAllWindows()
```

Tracking moving objects
with a bounding rectangle

25. Detect Simple Geometric Shapes

Contour Approximation: `cv2.approxPolyDP`

```
cv2.drawContours  
np.array  cnt = contours[4]           list  
         img = cv2.drawContours(img, [cnt], 0, (0,255,0), 3)
```

`numpy.ravel`: return a contiguous flattened array (1-D array).

```
>>> x = np.array([[1, 2, 3], [4, 5, 6]])      shape: (2, 3)
```

```
>>> np.ravel(x)  
array([1, 2, 3, 4, 5, 6])      shape: (6, )
```

```
>>> x.ravel()  
array([1, 2, 3, 4, 5, 6])      shape: (6, )
```

```
>>> len(x)
```

It approximates a contour shape to another shape with less number of vertices depending upon the precision we specify. It is an implementation of [Douglas-Peucker algorithm](#). Check the wikipedia page for algorithm and demonstration.

cv2.approxPolyDP

To understand this, suppose you are trying to find a square in an image, but due to some problems in the image, you didn't get a perfect square, but a "bad shape" (As shown in first image below).

Now you can use this function to approximate the shape. In this, second argument is called

`epsilon`, which is maximum distance from contour to approximated contour. It is an accuracy parameter. A wise selection of `epsilon` is needed to get the correct output.

```
epsilon = 0.1*cv2.arcLength(cnt,True)
approx = cv2.approxPolyDP(cnt,epsilon,True)
```

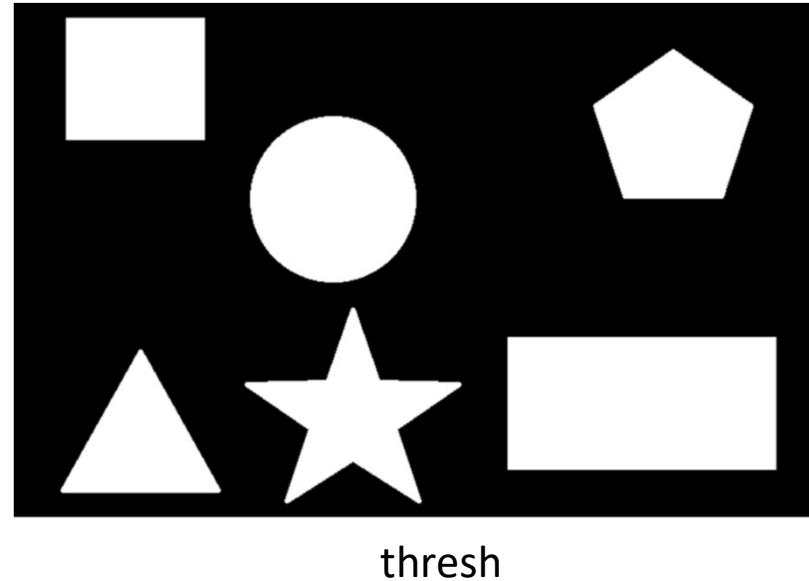

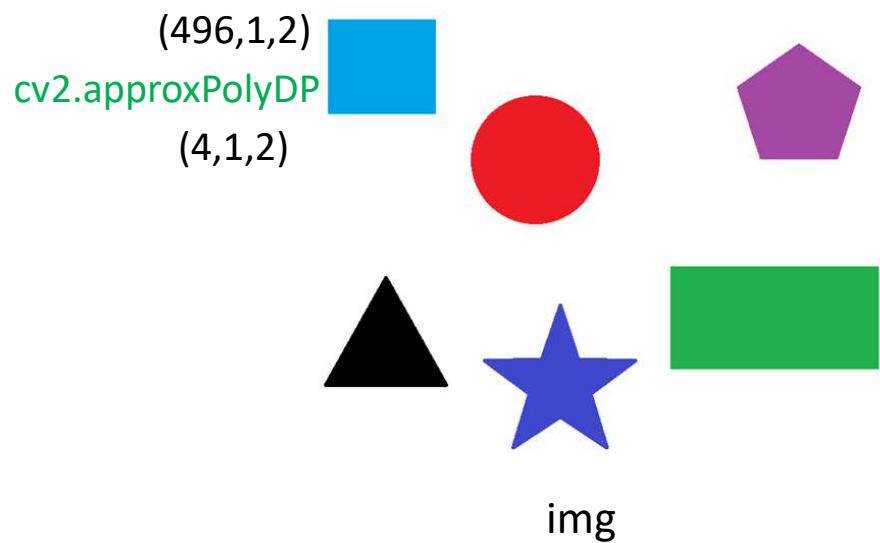

Below, in second image, green line shows the approximated curve for `epsilon = 10% of arc length`.

Third image shows the same for `epsilon = 1% of the arc length`. Third argument specifies whether curve is closed or not.

ex31.py

```
8 import numpy as np
9 import cv2
10
11 img = cv2.imread('shape.png')
12 imgGray = cv2.cvtColor(img, cv2.COLOR_BGR2GRAY)
13 _, thresh = cv2.threshold(imgGray, 240, 255, cv2.THRESH_BINARY_INV)
14 contours, _ = cv2.findContours(thresh, cv2.RETR_TREE, cv2.CHAIN_APPROX_NONE) # 6 contours
15
16 cv2.imshow("img", img)
```

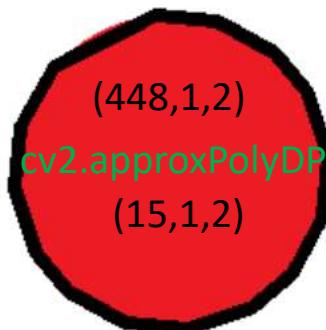

```
17 for contour in contours:
18     approx = cv2.approxPolyDP(contour, 0.01* cv2.arcLength(contour, True), True)
19     cv2.drawContours(img, [approx], 0, (0, 0, 0), 5) # black
20     x = approx.ravel()[0]
21     y = approx.ravel()[1] - 15
22     if len(approx) == 3:
23         cv2.putText(img, "Triangle", (x, y), cv2.FONT_HERSHEY_COMPLEX, 0.5, (0, 0, 0))
24     elif len(approx) == 4:
25         x1 ,y1, w, h = cv2.boundingRect(approx)
26         aspectRatio = float(w)/h
27         print(aspectRatio)
28         if aspectRatio >= 0.95 and aspectRatio <= 1.05:
29             cv2.putText(img, "square", (x, y), cv2.FONT_HERSHEY_COMPLEX, 0.5, (0, 0, 0))
30         else:
31             cv2.putText(img, "rectangle", (x, y), cv2.FONT_HERSHEY_COMPLEX, 0.5, (0, 0, 0))
32     elif len(approx) == 5:
33         cv2.putText(img, "Pentagon", (x, y), cv2.FONT_HERSHEY_COMPLEX, 0.5, (0, 0, 0))
34     elif len(approx) == 10:
35         cv2.putText(img, "Star", (x, y), cv2.FONT_HERSHEY_COMPLEX, 0.5, (0, 0, 0))
36     else:
37         cv2.putText(img, "Circle", (x, y), cv2.FONT_HERSHEY_COMPLEX, 0.5, (0, 0, 0))
38
39 cv2.imshow("shape", img)
40 cv2.waitKey(0)
41 cv2.destroyAllWindows()
```

26. Understanding image Histograms (直方圖)

Histogram: as a graph or plot, which gives you an overall idea about the intensity distribution of an image. It is a plot with pixel values (ranging from 0 to 255, not always) in X-axis and corresponding number of pixels in the image on Y-axis.

By looking at the histogram of an image, you get intuition about contrast, brightness, intensity distribution etc of that image.

ex32.py

Method 1: Matplotlib function

```
8 import cv2 as cv
9 from matplotlib import pyplot as plt
10
11 img = cv.imread("lena.jpg")
12 b, g, r = cv.split(img)
13 cv.imshow("img", img)
14 cv.imshow("b", b)
15 cv.imshow("g", g)
16 cv.imshow("r", r)
17
18 plt.hist(b.ravel(), 256, [0, 256], color='b')
19 plt.hist(g.ravel(), 256, [0, 256], color='g')
20 plt.hist(r.ravel(), 256, [0, 256], color='r')
21 # the upper boundary 256 is exclusive
22 plt.show()
23 cv.waitKey(0)
24 cv.destroyAllWindows()
25 ....
```

Compute and draw the histogram of `x`

```
plt.hist(x, bins=None, range=None, density=False, weights=None,  
cumulative=False, bottom=None, histtype='bar', align='mid', orientation='vertical',  
rwidth=None, log=False, color=None, label=None, stacked=False, *, data=None,  
**kwargs)
```

`x`: (n,) array or sequence of (n,) arrays

example:

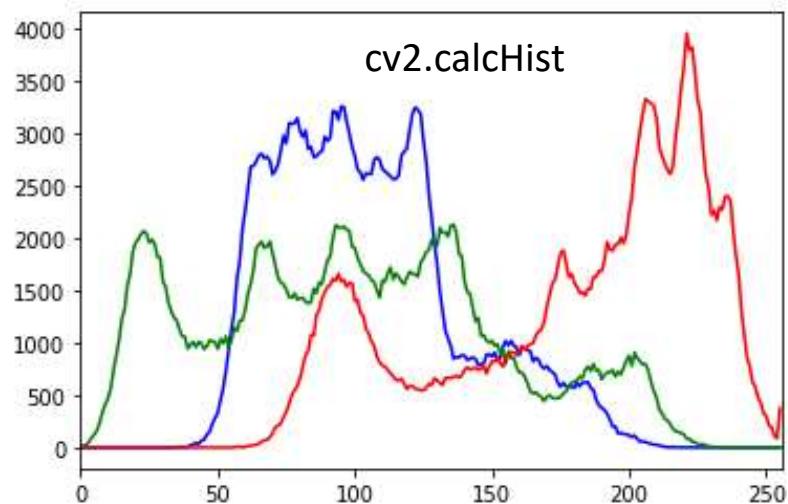

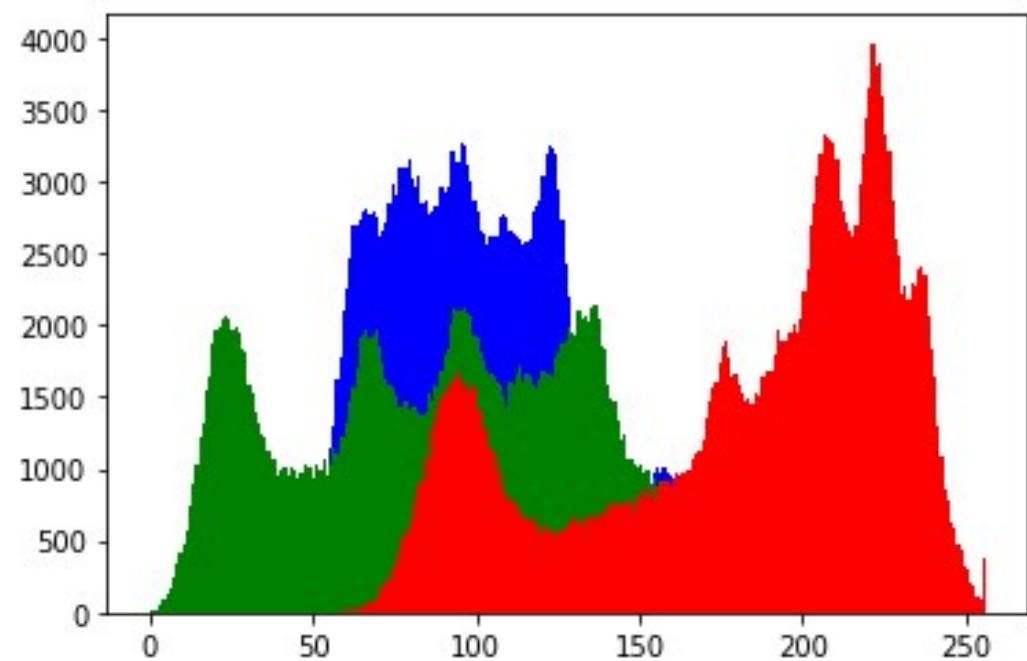

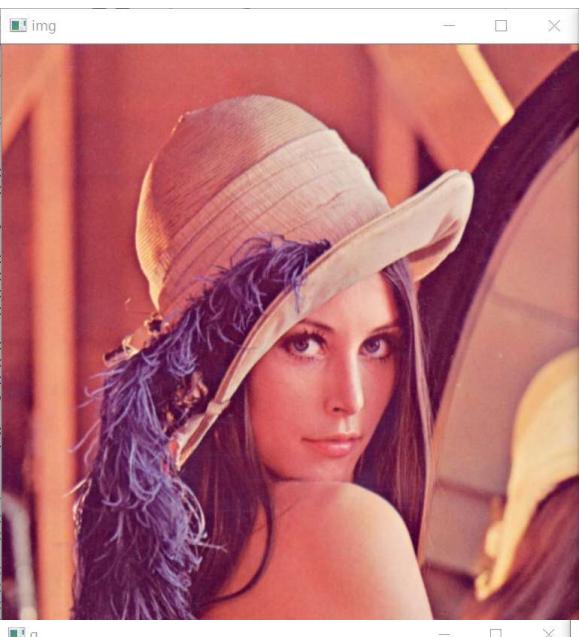

```
plt.hist(b.ravel(), 256, [0, 256], color='b')  
plt.hist(g.ravel(), 256, [0, 256], color='g')  
plt.hist(r.ravel(), 256, [0, 256], color='r')
```

`b.shape`

Out[2]: (512, 512)

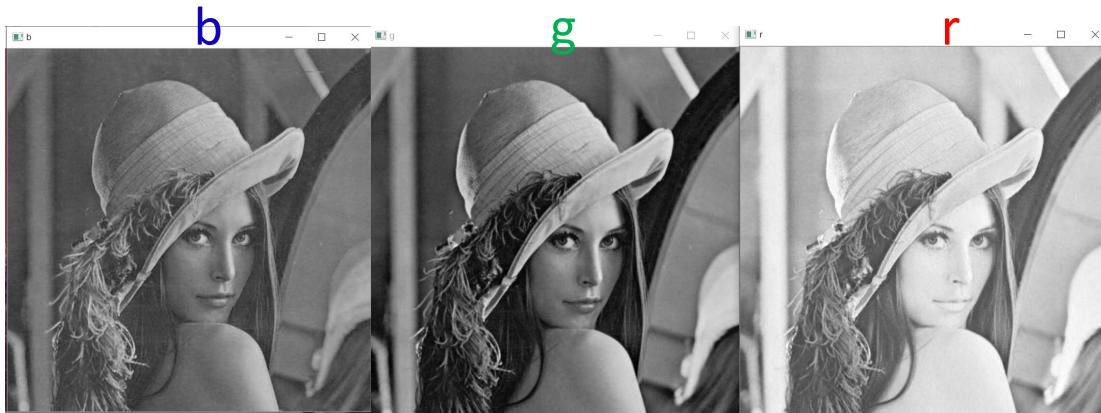

`b.ravel().shape`

Out[4]: (262144,)

26. Understanding image Histograms (直方圖)

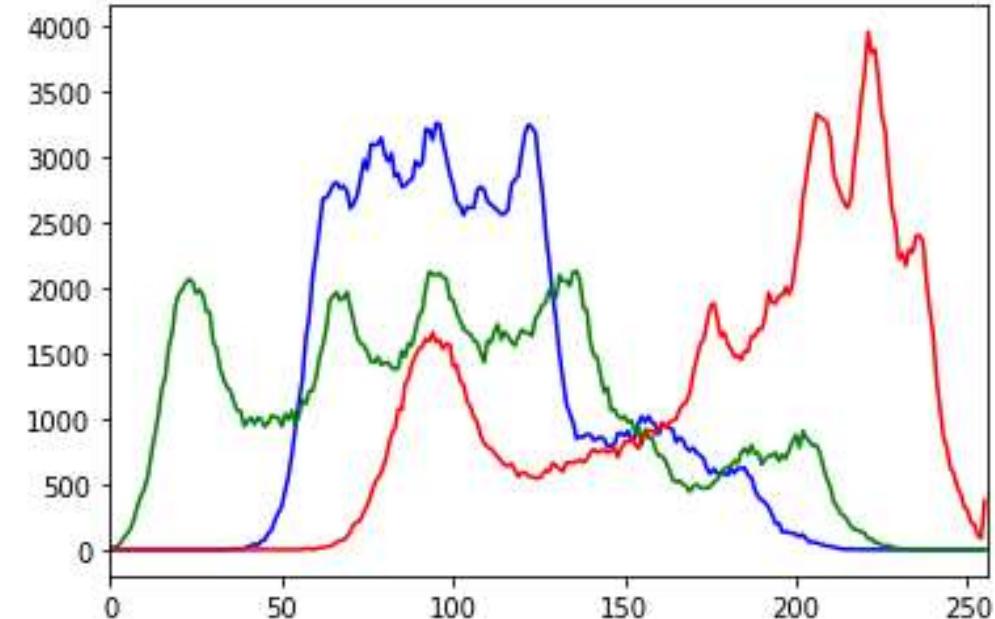

```
8 import cv2
9 from matplotlib import pyplot as plt
10
11 img = cv2.imread('lena.jpg')
12 color = ('b','g','r')
13 for i,col in enumerate(color):
14     histr = cv2.calcHist([img],[i],None,[256],[0,256]) # the upper boundary 256 is exclusive
15     plt.plot(histr,color = col)
16     plt.xlim([0,256])
17 plt.show()
```

Method 2: OpenCV function

cv2.calcHist([src], [0], None, [histSize], [histRange])
channel mask

ex33.py

27. Template Matching

To find objects in an image using Template Matching

40 x52

https://docs.opencv.org/master/d4/dc6/tutorial_py_template_matching.html

```
res = cv2.matchTemplate(src, template, method)  
                                (grayscale image)
```

```
6 methods = ['cv.TM_CCOEFF', 'cv.TM_CCOEFF_NORMED',  
'cv.TM_CCORR', 'cv.TM_CCORR_NORMED',  
'cv.TM_SQDIFF', 'cv.TM_SQDIFF_NORMED']
```

Take **minimum value** for TM_SQDIFF and
TM_SQDIFF_NORMED

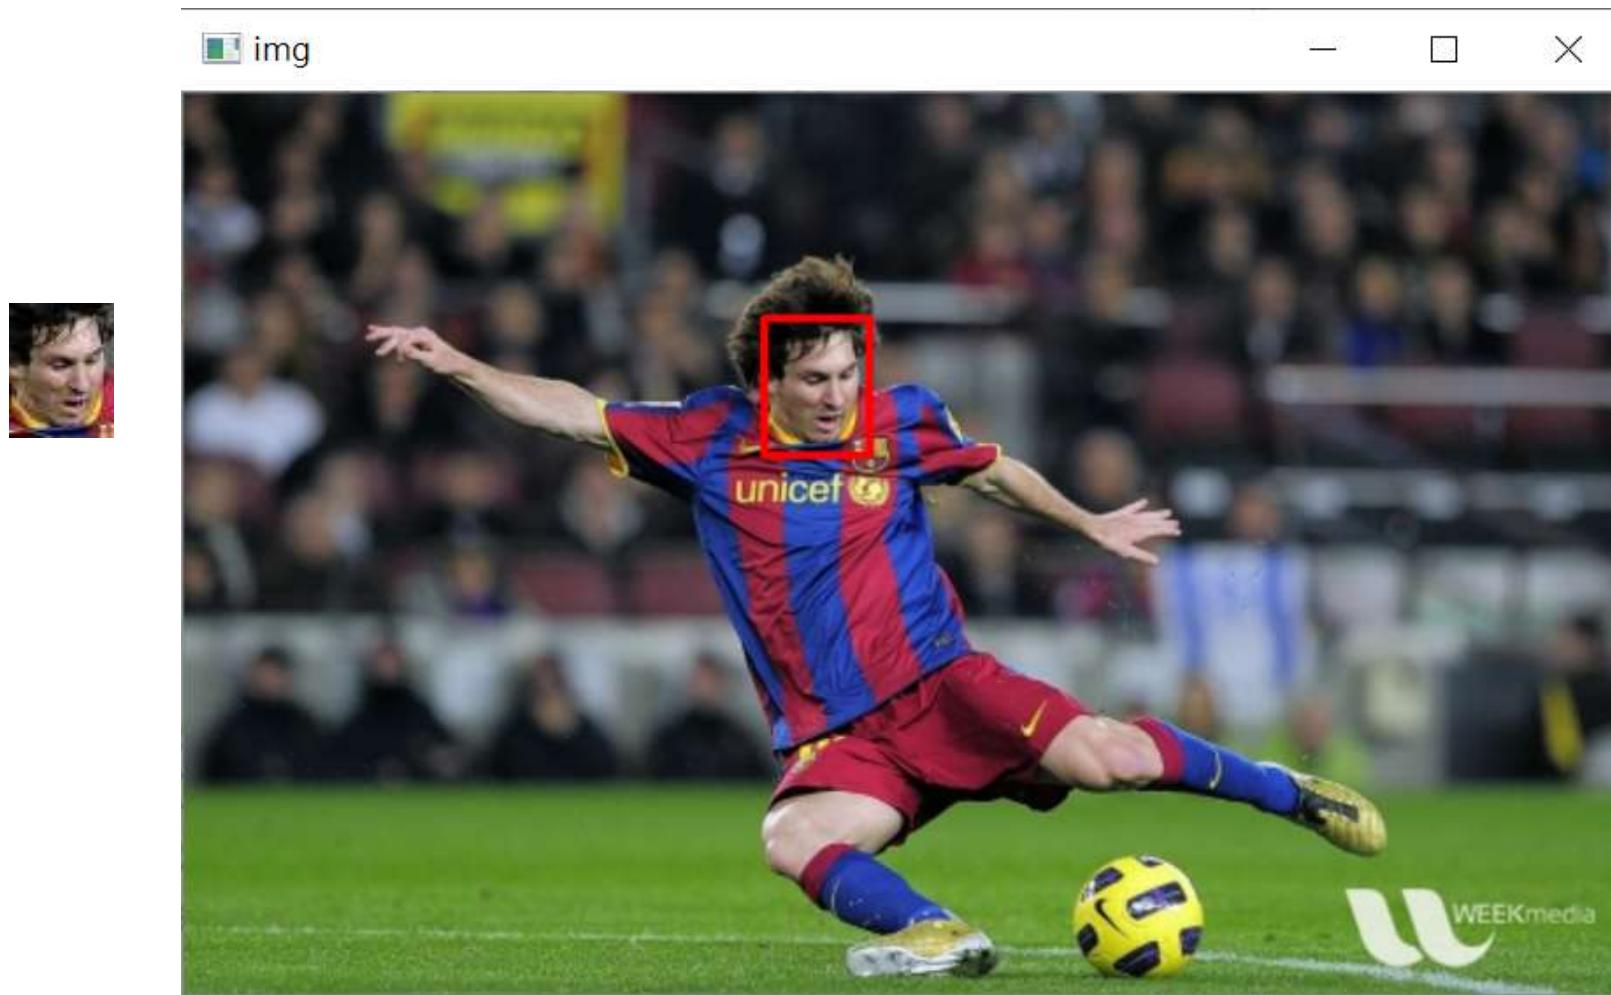

548 x 342

ex34.py

```
8 import cv2
9 import numpy as np
10 img = cv2.imread("messi5.jpg")
11 grey_img = cv2.cvtColor(img, cv2.COLOR_BGR2GRAY) # grayscale
12 template = cv2.imread("messi_face.jpg", 0) # grayscale
13 w, h = template.shape[::-1]
14 # w=40, h=52
15 res = cv2.matchTemplate(grey_img, template, cv2.TM_CCORR_NORMED )
16 print(res)
17 threshold = 0.99;
18 loc = np.where(res >= threshold)
19 print(loc) # (array([85], dtype=int64), array([220], dtype=int64)) top_left corner of rectangle
20 for pt in zip(*loc[::-1]):
21     cv2.rectangle(img, pt, (pt[0] + w, pt[1] + h), (0, 0, 255), 2)
22
23 cv2.imshow("img", img)
24 cv2.waitKey(0)
25 cv2.destroyAllWindows()
```

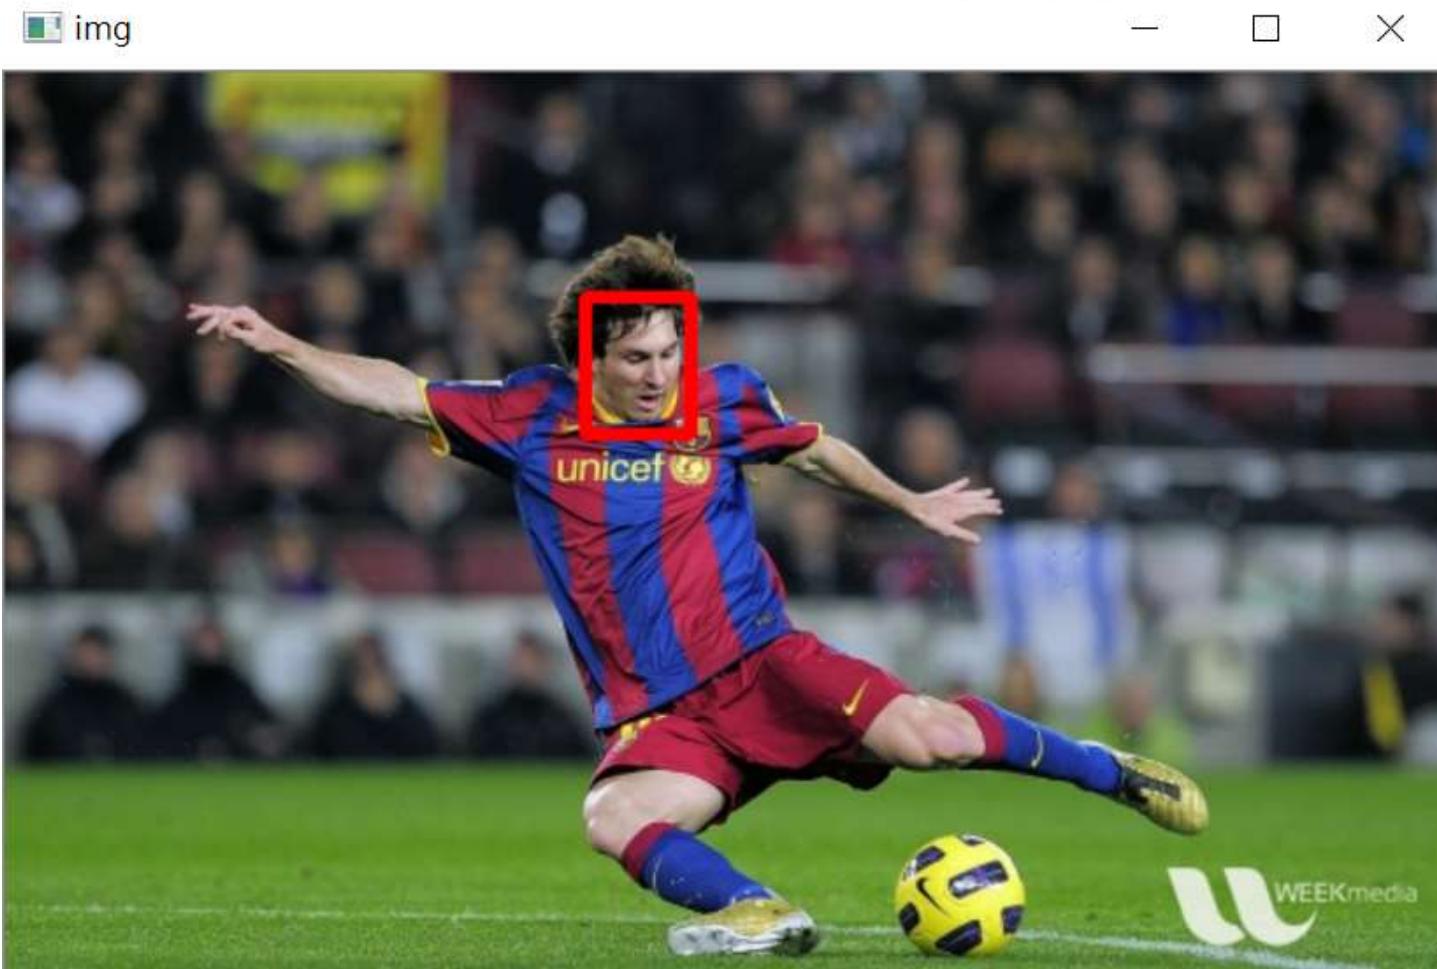

template.shape
(52, 40)

threshold = 0.99

threshold = 0.95

5 loc : (array([84, 85, 85, 85, 86], dtype=int64), array([220, 219, 220, 221, 220], dtype=int64))

28. Hough Line Transform Theory

To understand the concept of the Hough Transform and Hough Line Transform Theory.

OpenCV implements two kind of Hough Line Transforms:

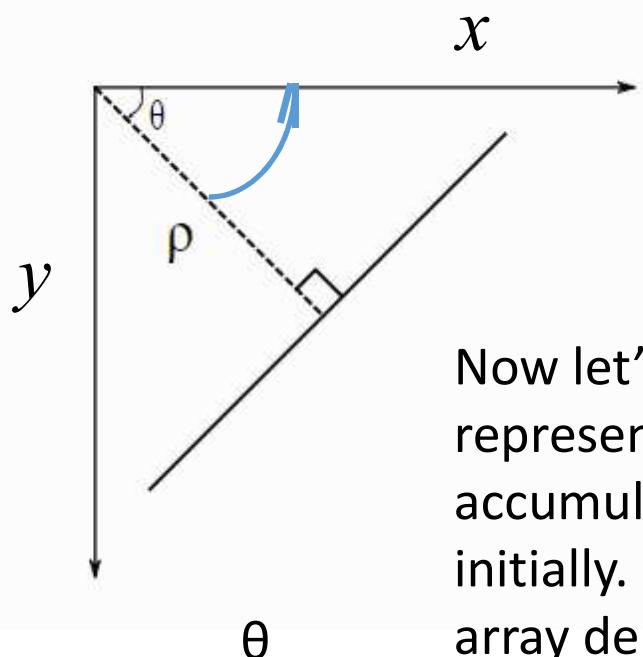

The Standard Hough Transform (`HoughLines` method)

The Probabilistic Hough Line Transform (`HoughLinesP` method)

Hough Transform is a popular technique to detect any shape, if you can represent that shape in mathematical form. It can detect the shape even if it is broken or distorted a little bit. **We will see how it works for a line.**

A line in Cartesian coordinate:

$$y = m x + c$$

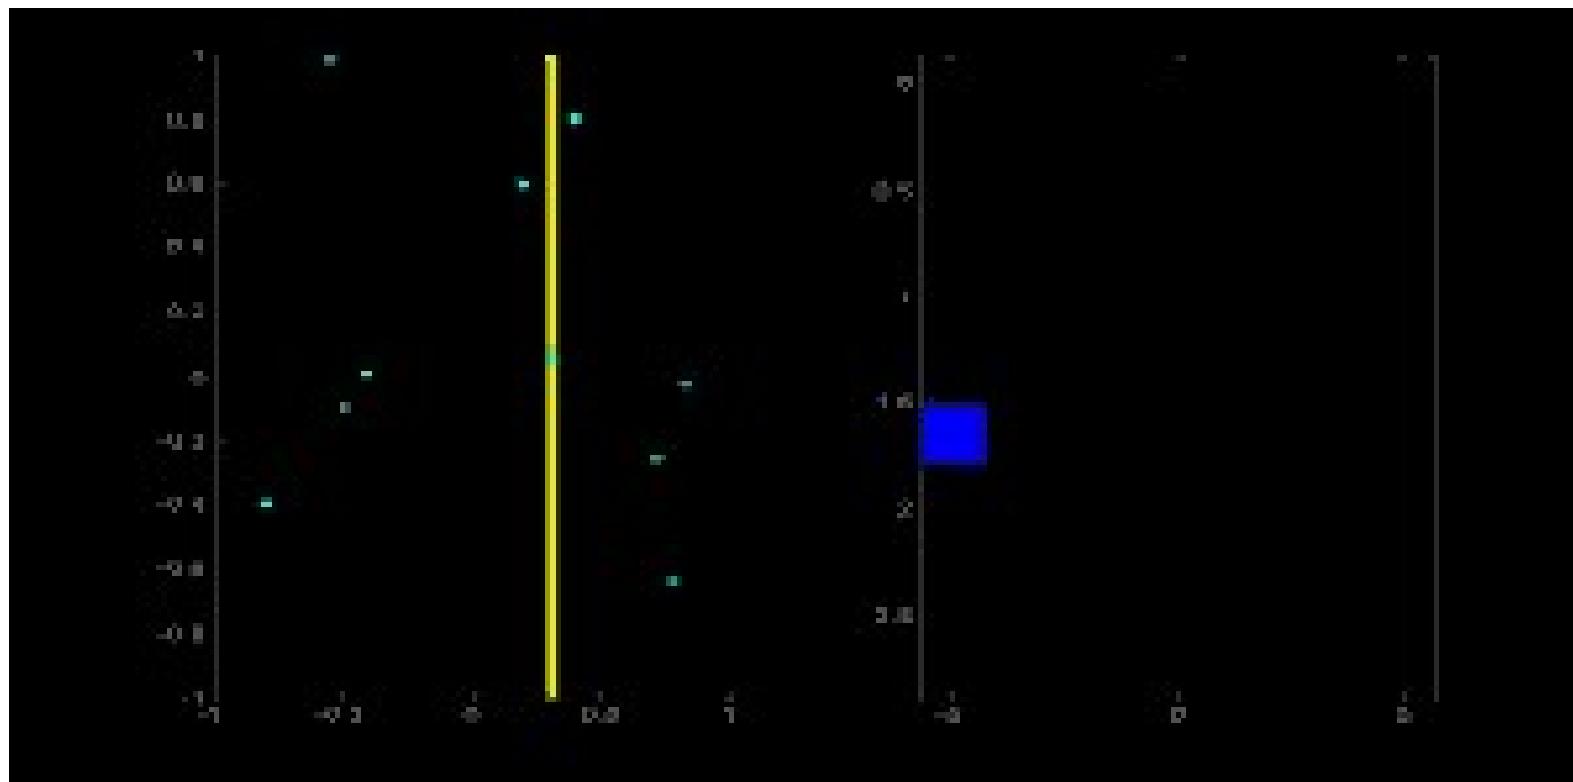

ρ θ
2D array accumulator

or in parametric form, as $\rho = x \cos\theta + y \sin\theta$
where ρ is the perpendicular distance from origin to the line, and θ is the angle formed by this perpendicular line and horizontal axis measured in counter-clockwise.

Now let's see how Hough Transform works for lines. Any line can be represented in these two terms, (ρ, θ) . So first it creates a 2D array or accumulator (to hold values of two parameters) and it is set to 0 initially. Let rows denote the ρ and columns denote the θ . Size of array depends on the accuracy you need. Suppose you want the accuracy of angles to be 1 degree, you need 180 columns. For ρ , the maximum distance possible is the diagonal length of the image. So taking one pixel accuracy, number of rows can be diagonal length of the image.

So a line in Cartesian coordinate has a corresponding point (ρ, θ) in the 2D array or accumulator.

(Image Courtesy: Amos Storkey)

$$(\rho, \theta) = (50, 90)$$

$$\rho = x \cos\theta + y \sin\theta$$

Consider a 100x100 image with a horizontal line at the middle. Take the first point of the line. You know its (x,y) values. Now in the line equation, put the values $\theta = 0, 1, 2, \dots, 180$ and check the ρ you get. For every (ρ, θ) pair, you increment value by one in our accumulator in its corresponding (ρ, θ) cells. So now in accumulator, the cell $(50, 90) = 1$ along with some other cells.

Now take the second point on the line. Do the same as above. Increment the the values in the cells corresponding to (ρ, θ) you got. This time, the cell $(50, 90) = 2$. What you actually do is voting the (ρ, θ) values. You continue this process for every point on the line. At each point, the cell $(50, 90)$ will be incremented or voted up, while other cells may or may not be voted up. This way, at the end, the cell $(50, 90)$ will have maximum votes. So if you search the accumulator for maximum votes, you get the value $(50, 90)$ which says, there is a line in this image at distance 50 from origin and at angle 90 degrees.

Hough transformation Algorithm

- 1. Edge detection, e.g. using the Canny edge detector.
- 2. Mapping of edge points to the Hough space and storage in an accumulator.
- 3. Interpretation of the accumulator to yield lines of infinite length. The interpretation is done by thresholding and possibly other constraints.
- 4. Conversion of infinite lines to finite lines.

29. Hough Line Transform using HoughLines method

`cv2.Canny(grayimg, minVal, maxVal, aperture_size):`

First argument is our input image.

Second and third arguments are our minVal and maxVal respectively. Fourth argument is aperture_size. It is the size of Sobel kernel used for find image gradients. By default it is 3.

29. Hough Line Transform using HoughLines method

```
lines = cv.HoughLines(image, rho, theta, threshold)
```

image: source image. (binary image)

lines: Output vector of lines. Each line is represented by a 2 or 3 element vector (ρ, θ) or ($\rho, \theta, \text{votes}$).
 ρ is the distance from the coordinate origin (0,0) (top-left corner of the image). θ is the line rotation angle in radians . votes is the value of accumulator.

rho: Distance resolution of the accumulator in pixels.

theta: Angle resolution of the accumulator in radians.

threshold: Accumulator threshold parameter. Only those lines are returned that get enough votes ($>\text{threshold}$).

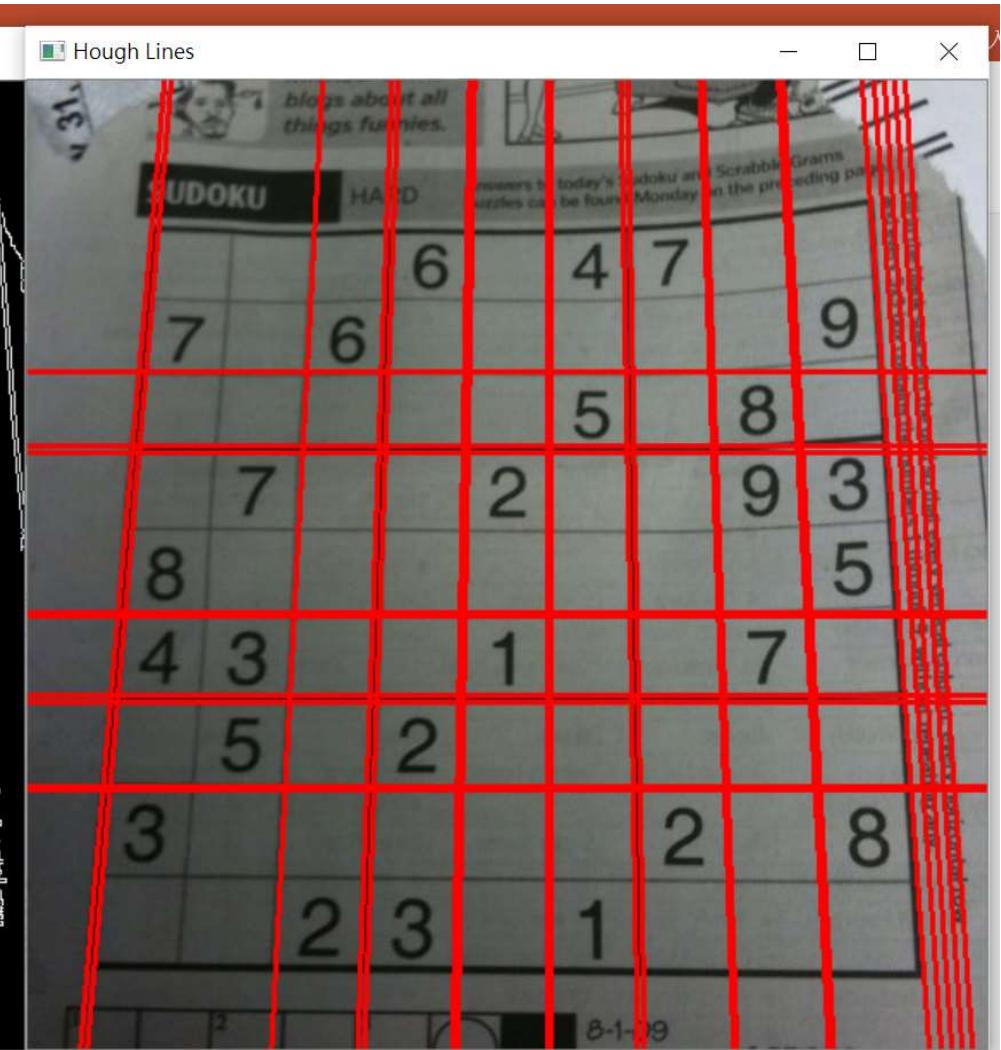

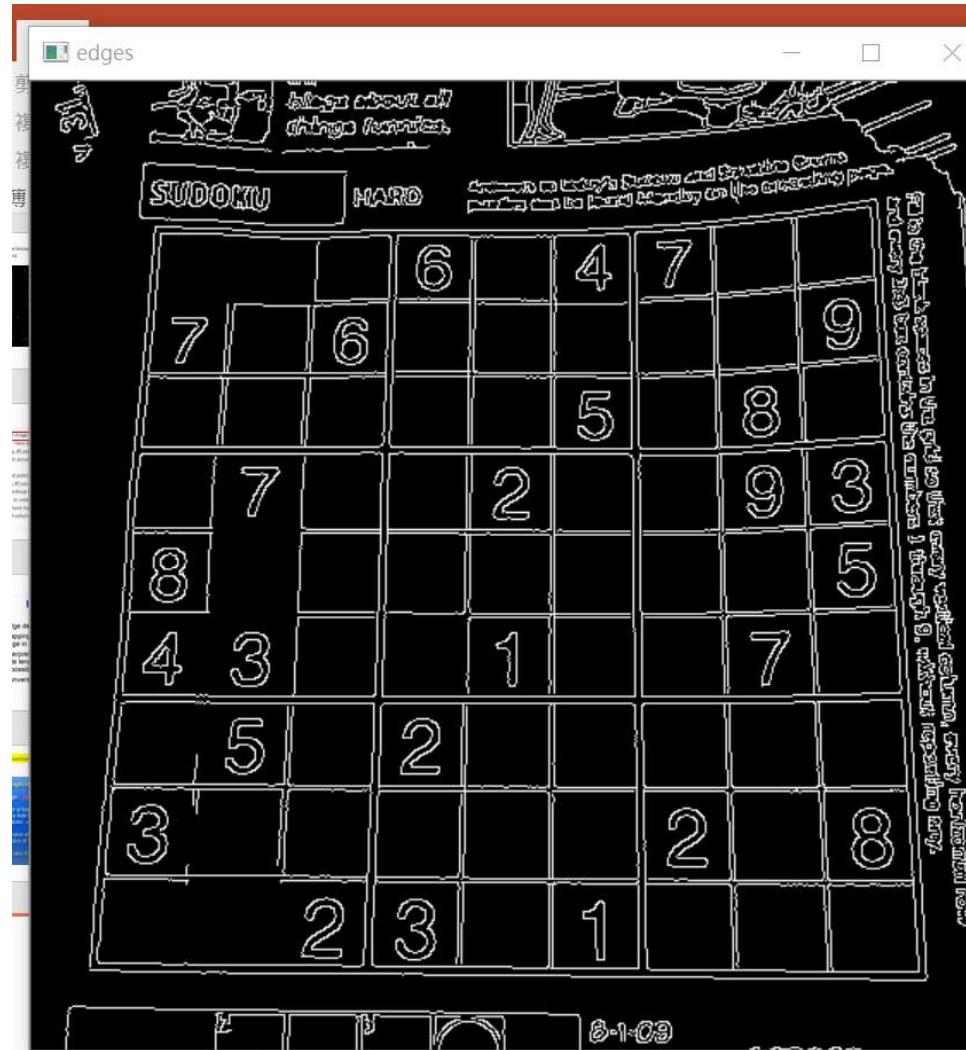

ex35.py

(x_1, y_1) and
 (x_2, y_2)
satisfy the
line equation

$$\rho = x \cos\theta + y \sin\theta$$

30. Probabilistic Hough Transform using HoughLinesP

```
lines=cv.HoughLinesP(image, rho, theta, threshold[, lines[, minLineLength[, maxLineGap]]])
```

rho: Distance resolution of the accumulator in pixels.

theta: Angle resolution of the accumulator in radians.

threshold: Accumulator threshold parameter. Only those lines are returned that get enough votes ($> \text{threshold}$).

minLineLength: Minimum length of line. Line segments shorter than this are rejected.

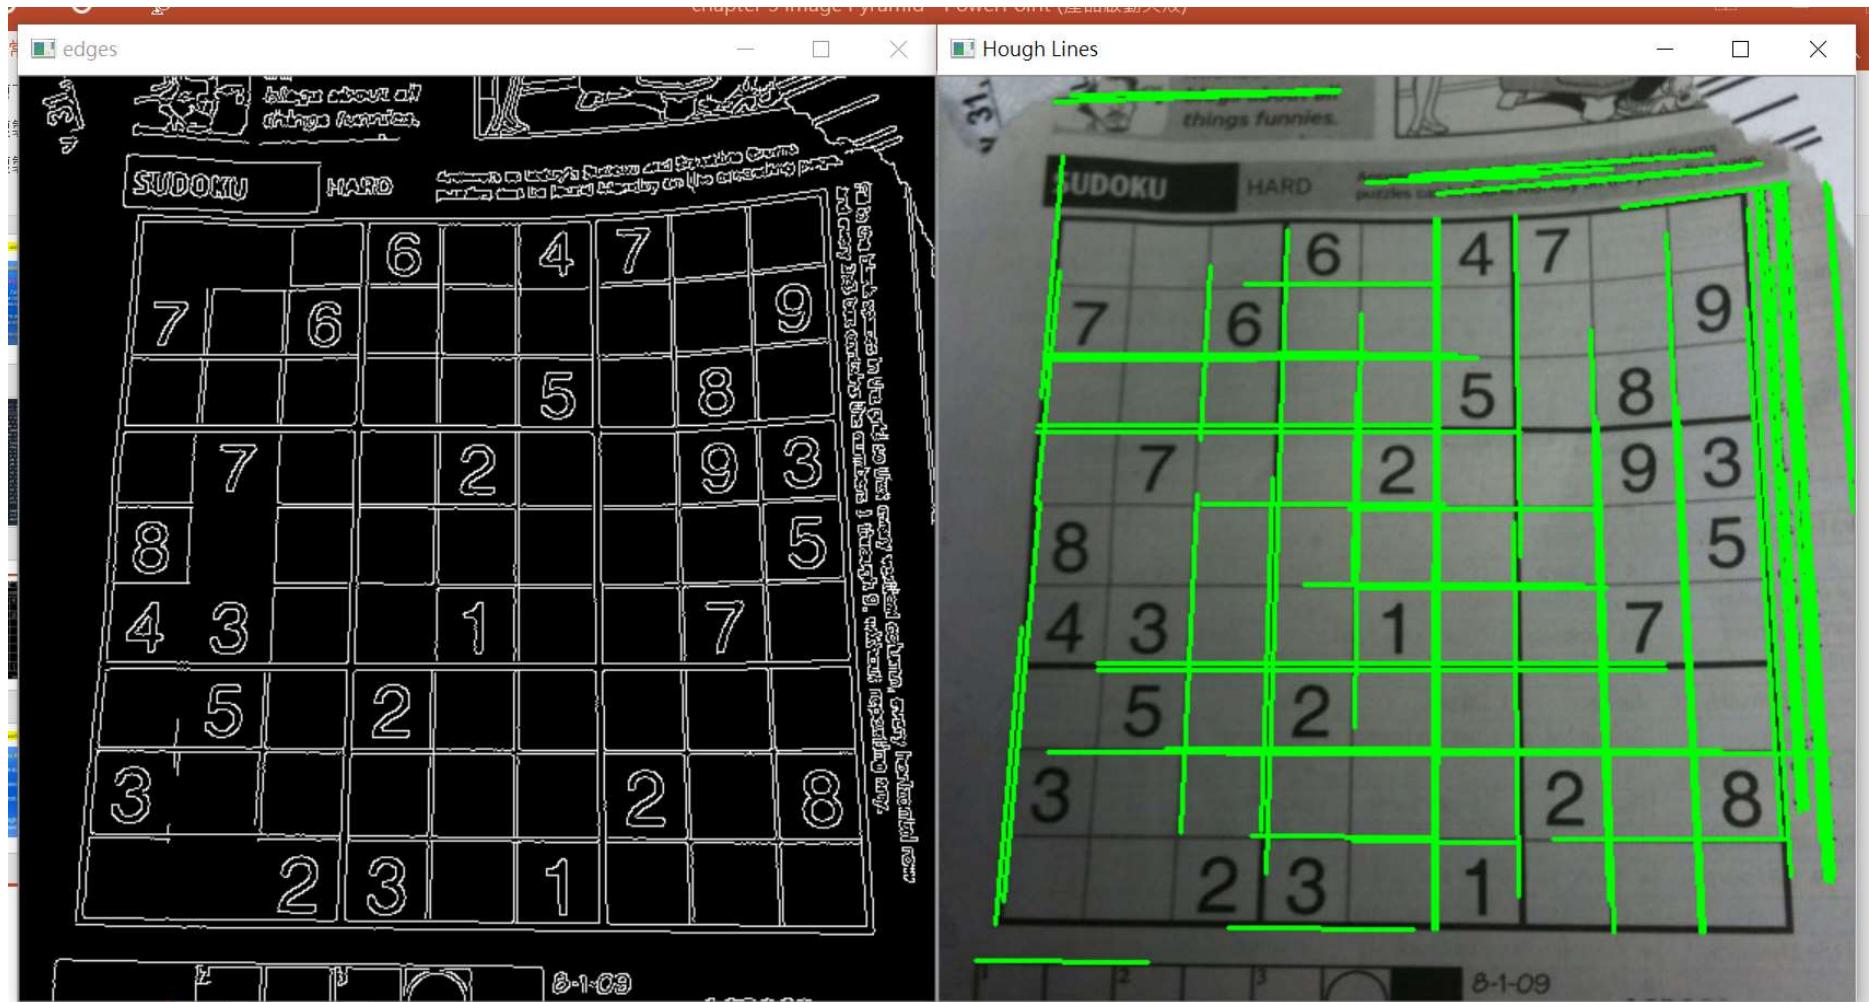

maxLineGap: Maximum allowed gap between line segments to treat them as a single line.

ex37.py

```
Img = cv.fillPoly(img, pts, color[, lineType[, shift[, offset]]])
```

Fills the area bounded by one or more polygons.

```
cv2.fillPoly(mask, vertices, match_mask_color)
```

Parameters

img Image.

pts Array of polygons where each polygon is represented as an array of points.

color Polygon color.

lineType Type of the polygon boundaries. See LineTypes

shift Number of fractional bits in the vertex coordinates.

offset Optional offset of all points of the contours.
